

Assessment Test: Software Tester (QA) - Task Management Application

Full Name: Mansi

Email ID: mansi.vipin.cse.2023@miet.ac.in

Contact Number: 7455997659

Understanding of the App

App has Registration, Login, and after login users can Create/View/Edit/Delete tasks. Tasks are saved in DB and shown in a list. Since it's said to be near production and there's no test docs, I'm testing this purely based on the features mentioned and general QA thinking, not by actually running it.

I'm not covering every single possible case here (didn't get time to think of literally everything), just tried to hit the important positive/negative/edge scenarios for each part.

Part 1: Test Cases

Registration

TC ID	Test Case	Type	Steps	Expected Result
REG-01	Register with valid details	Positive	Fill name, email, password correctly and submit	Account should be created successfully
REG-02	Register with an email that's already used	Negative	Use an existing email again	Should show error like "email already exists"
REG-03	Enter invalid email format	Negative	e.g. mansi@@test or mansi.com	Should give validation error
REG-04	Leave fields empty	Negative	Click submit without filling anything	Required field errors should show
REG-05	Enter a weak password (like "123")	Negative	Try short/simple password	Should be rejected if there's a password policy
REG-06	Password and confirm password not matching	Negative	Enter different values in both	Error should show, form shouldn't submit
REG-07	Try SQL/script as input in name field	Edge/ Security	Enter something like <script> tag	Should not break the app or execute anything

Login

TC ID	Test Case	Type	Steps	Expected Result
LOG-01	Login with correct email/password	Positive	Use valid registered credentials	Should log in and go to dashboard
LOG-02	Login with wrong password	Negative	Correct email, wrong password	Should show invalid credentials error

TC ID	Test Case	Type	Steps	Expected Result
LOG-03	Login with unregistered email	Negative	Random email not in system	Same generic error, shouldn't say "email not found" separately
LOG-04	Leave login fields blank	Negative	Submit empty form	Required field errors
LOG-05	Try wrong password many times in a row	Edge	Enter wrong password 5+ times	Ideally should lock the account or show captcha, otherwise it's risky

Task CRUD

TC ID	Test Case	Type	Steps	Expected Result
TASK-01	Create a task with valid data	Positive	Fill title/description, save	Task should appear in list
TASK-02	Create task with empty title	Negative	Leave title blank, save	Should not save, error should show
TASK-03	Edit an existing task	Positive	Change title/date of a task and save	Updated data should reflect
TASK-04	Delete a task	Positive	Click delete on a task	Task should be removed from list
TASK-05	Cancel delete confirmation	Edge	Click delete, then cancel the popup	Task should stay as it was
TASK-06	Try opening another user's task by changing ID in URL	Security	Change task id in url/api manually	Should not be allowed to access
TASK-07	Check task list when there are no tasks	Edge	Login with new account, no tasks created yet	Should show empty state, not a broken page

Input Validation

TC ID	Test Case	Type	Steps	Expected Result
VAL-01	Enter very long text in title field	Edge	Type a huge paragraph as title	Should either limit characters or handle gracefully
VAL-02	Enter special characters/emoji in title	Edge	Type something like "Task @#!"	Should be accepted and displayed properly
VAL-03	Select a past due date	Edge	Pick yesterday's date	Should either warn or block, needs to be consistent
VAL-04	Click save button multiple times fast	Edge	Double click save quickly	Should not create duplicate tasks

Part 2: Bugs / Risk Areas (without executing the app)

1. Passwords might not be encrypted - Severity: Critical

Nothing about hashing is mentioned, so if it's stored as plain text that's a big risk if DB ever leaks.

2. No login attempt limit - Severity: Critical

No mention of lockout after multiple wrong password tries, so brute-force attack is possible.

3. Task access might not check ownership properly (IDOR) - Severity: Critical

If task IDs are simple numbers, a user might access someone else's task just by changing the ID, unless backend checks who the task belongs to.

4. No sanitization of task title/description mentioned - Severity: Major

If user input like <script> isn't cleaned before displaying, could lead to XSS attack.

5. No confirmation before deleting a task (or unclear) - Severity: Major

Deleting is permanent as per given info, one wrong click and task is gone with no way to recover it.

6. Validation may only be frontend, not backend - Severity: Major

If only JS validates input and backend doesn't recheck, bad data could still enter DB via direct API calls.

7. Duplicate task creation on fast double click - Severity: Minor

If Save button isn't disabled after first click, same task might get created twice.

8. Session timeout not defined - Severity: Minor

Not clear if user gets logged out automatically after being idle, which is a small security gap especially on shared computers.
